### Seeking Life's Bare (Genetic) Necessities

COLD SPRING HARBOR, NEW YORK—How many **genes** does an **organism** need to survive? Last week at the genome meeting here,\* two genome researchers with radically different approaches presented complementary views of the basic genes needed for **life**. One research team, using **computer** analyses to compare known **genomes**, concluded that today's **organisms** can be sustained with just 250 genes, and that the earliest life forms required a mere 128 **genes**. The other researcher mapped genes in a simple parasite and estimated that for this organism, 800 genes are plenty to do the job—but that anything short of 100 wouldn't be enough.

Although the numbers don't match precisely, those **predictions**

"are not all that far apart," especially in comparison to the 75,000 **genes** in the human genome, notes Siv Andersson at Uppsala University in Sweden, who arrived at the 800 number. But coming up with a consensus answer may be more than just a **genetic numbers** game, particularly as more and more **genomes** are completely sequenced and analyzed. "It may be a way of organizing any newly **sequenced genome**," explains Arcady Mushegian, a **computational** molecular biologist at the National Center for Biotechnology Information (NCBI) in Bethesda, Maryland. Comparing an

\* Genome Mapping and Sequencing, Cold Spring Harbor, New York, May 8 to 12.

**Stripping down.** Computer analysis yields an estimate of the minimum modern and ancient genomes.

SCIENCE • VOL. 272 • 24 MAY 1996

## Topic proportions and assignments

# Latent Dirichlet Allocation

- ▶ Document = random mixture over latent topics
- ▶ Topic = distribution over n-grams

Probabilistic model with 3 steps:

1. Choose  $\theta_i \sim \text{Dirichlet}(\alpha)$
2. Choose  $\beta_k \sim \text{Dirichlet}(\delta)$
3. For each word in document  $i$ :
  - ▶ Choose a topic  $z_m \sim \text{Multinomial}(\theta_i)$
  - ▶ Choose a word  $w_{im} \sim \text{Multinomial}(\beta_{i,k=z_m})$

where:

$\alpha$ =parameter of Dirichlet prior on distribution of topics over docs.

$\theta_i$ =topic distribution for document  $i$

$\delta$ =parameter of Dirichlet prior on distribution of words over topics

$\beta_k$ =word distribution for topic  $k$

# Latent Dirichlet Allocation

Key parameters:

1.  $\theta$  = matrix of dimensions N documents by K topics where  $\theta_{ik}$  corresponds to the probability that document  $i$  belongs to topic  $k$ ; i.e. assuming  $K = 5$ :

	T1	T2	T3	T4	T5
Document 1	0.15	0.15	0.05	0.10	0.55
Document 2	0.80	0.02	0.02	0.10	0.06
...					
Document $N$	0.01	0.01	0.96	0.01	0.01

# Latent Dirichlet Allocation

Key parameters:

1.  $\theta$  = matrix of dimensions N documents by K topics where  $\theta_{ik}$  corresponds to the probability that document  $i$  belongs to topic  $k$ ; i.e. assuming  $K = 5$ :

	T1	T2	T3	T4	T5
Document 1	0.15	0.15	0.05	0.10	0.55
Document 2	0.80	0.02	0.02	0.10	0.06
...					
Document $N$	0.01	0.01	0.96	0.01	0.01

2.  $\beta$  = matrix of dimensions K topics by M words where  $\beta_{km}$  corresponds to the probability that word  $m$  belongs to topic  $k$ ; i.e. assuming  $M = 6$ :

	W1	W2	W3	W4	W5	W6
Topic 1	0.40	0.05	0.05	0.10	0.10	0.30
Topic 2	0.10	0.10	0.10	0.50	0.10	0.10
...						
Topic $k$	0.05	0.60	0.10	0.05	0.10	0.10

# Validation

From Quinn et al, AJPS, 2010:

1. Semantic validity

# Validation

From Quinn et al, AJPS, 2010:

1. Semantic validity

- ▶ Do the topics identify coherent groups of tweets that are internally homogenous, and are related to each other in a meaningful way?

# Validation

From Quinn et al, AJPS, 2010:

1. Semantic validity
  - ▶ Do the topics identify coherent groups of tweets that are internally homogenous, and are related to each other in a meaningful way?
2. Convergent/discriminant construct validity

# Validation

From Quinn et al, AJPS, 2010:

1. Semantic validity

- ▶ Do the topics identify coherent groups of tweets that are internally homogenous, and are related to each other in a meaningful way?

2. Convergent/discriminant construct validity

- ▶ Do the topics match existing measures where they should match?

# Validation

From Quinn et al, AJPS, 2010:

## 1. Semantic validity

- ▶ Do the topics identify coherent groups of tweets that are internally homogenous, and are related to each other in a meaningful way?

## 2. Convergent/discriminant construct validity

- ▶ Do the topics match existing measures where they should match?
- ▶ Do they depart from existing measures where they should depart?

# Validation

From Quinn et al, AJPS, 2010:

1. Semantic validity

- ▶ Do the topics identify coherent groups of tweets that are internally homogenous, and are related to each other in a meaningful way?

2. Convergent/discriminant construct validity

- ▶ Do the topics match existing measures where they should match?
- ▶ Do they depart from existing measures where they should depart?

3. Predictive validity

# Validation

From Quinn et al, AJPS, 2010:

## 1. Semantic validity

- ▶ Do the topics identify coherent groups of tweets that are internally homogenous, and are related to each other in a meaningful way?

## 2. Convergent/discriminant construct validity

- ▶ Do the topics match existing measures where they should match?
- ▶ Do they depart from existing measures where they should depart?

## 3. Predictive validity

- ▶ Does variation in topic usage correspond with expected events?

# Validation

From Quinn et al, AJPS, 2010:

1. Semantic validity
  - ▶ Do the topics identify coherent groups of tweets that are internally homogenous, and are related to each other in a meaningful way?
2. Convergent/discriminant construct validity
  - ▶ Do the topics match existing measures where they should match?
  - ▶ Do they depart from existing measures where they should depart?
3. Predictive validity
  - ▶ Does variation in topic usage correspond with expected events?
4. Hypothesis validity

# Validation

From Quinn et al, AJPS, 2010:

## 1. Semantic validity

- ▶ Do the topics identify coherent groups of tweets that are internally homogenous, and are related to each other in a meaningful way?

## 2. Convergent/discriminant construct validity

- ▶ Do the topics match existing measures where they should match?
- ▶ Do they depart from existing measures where they should depart?

## 3. Predictive validity

- ▶ Does variation in topic usage correspond with expected events?

## 4. Hypothesis validity

- ▶ Can topic variation be used effectively to test substantive hypotheses?

## Example: open-ended survey responses

Bauer, Barberá *et al*, *Political Behavior*, 2016.

- ▶ Data: General Social Survey (2008) in Germany
- ▶ Responses to questions: *Would you please tell me what you associate with the term “left”? and would you please tell me what you associate with the term “right”?*
- ▶ Open-ended questions minimize priming and potential interviewer effects
- ▶ Sparse Additive Generative model instead of LDA (more coherent topics for short text)
- ▶  $K = 4$  topics for each question

# Example: open-ended survey responses

Table 1: Top scoring words associated with each topic, and English translations)

<p>Left topic 1: <b>Parties</b> (proportion = .26, average lr-scale value = 5.38)  linke, spd, partei, linken, pds, politik, kommunisten, parteien, grünen, punks  <i>the left, spd, party, the left, pds, politics, communists, parties, greens, punks</i></p>
<p>Left topic 2: <b>Ideologies</b> (proportion = .26, average lr-scale value = 5.36)  kommunismus, links, sozialismus, lafontaine, rechts, aber, gysi, linkspartei, richtung, gleichmacherei  <i>communism, left, socialism, lafontaine, right, but, gysi, left party, direction, levelling</i></p>
<p>Left topic 3: <b>Values</b> (proportion = .24, average lr-scale value = 4.06)  soziale, gerechtigkeit, demokratie, soziales, bürger, gleichheit, gleiche, freiheit, rechte, gleichberechtigung  <i>social, justice, democracy, social, citizen, equality, equal, freedom, rights, equal rights</i></p>
<p>Left topic 4: <b>Policies</b> (proportion = .24, average lr-scale value = 4.89)  sozial, menschen, leute, ddr, verbinde, kleinen, einstellung, umverteilung, sozialen, vertreten  <i>social, humans, people, ddr, associate, the little, attitude, redistribution, social, represent</i></p>
<p>Right topic 1: <b>Ideologies</b> (proportion = .27, average lr-scale value = 5.00)  konservativ, nationalsozialismus, rechtsradikal, radikal, ordnung, politik, nazi, recht, menschen, konservative  <i>conservative, national socialism, right-wing radicalism, radical, order, politics, nazi, right, people, conservatives</i></p>
<p>Right topic 2: <b>Parties</b> (proportion = .25, average lr-scale value = 5.26)  npd, rechts, cdu, csu, rechten, parteien, leute, aber, verbinde, rechtsradikalen  <i>npd, right, cdu, csu, the right, parties, people, but, associate, right-wing radicalists</i></p>
<p>Right topic 3: <b>Xenophobia</b> (proportion = .25, average lr-scale value = 4.55)  ausländerfeindlichkeit, gewalt, ausländer, demokratie, nationalismus, rechtsradikalismus, diktatur, national, intoleranz, faschismus  <i>xenophobia, violence, foreigners, democracy, nationalism, right-wing radicalism, dictatorship, national, intolerance, fascism</i></p>
<p>Right topic 4: <b>Right-wing extremists</b> (proportion = .23, average lr-scale value = 4.90)  nazis, neonazis, rechtsradikale, rechte, radikale, radikalismus, partei, ausländerfeindlich, reich, nationale  <i>nazis, neonazis, right-wing radicalists, rightists, radicals, radicalism, party, xenophobia, rich, national</i></p>

**Note:** “proportion” indicates the average estimated probability that any given response is assigned to a topic. “average lr-scale value” is the mean position on the left-right scale (from 0 to 10) of individuals whose highest probability belongs to that particular topic.

# Example: open-ended survey responses

Fig. 6: Left-right scale means for different subsamples of associations with **left** (dashed = sample mean, bars = 95% Cis)

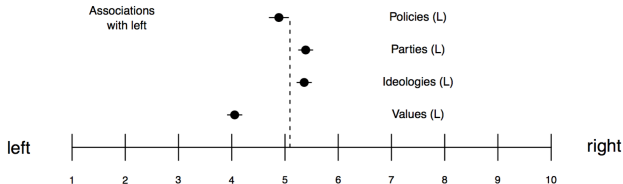

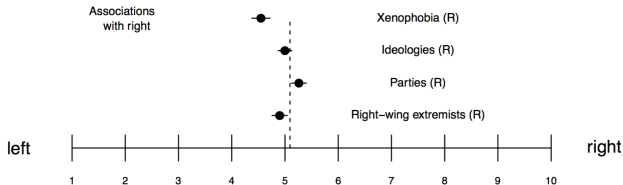

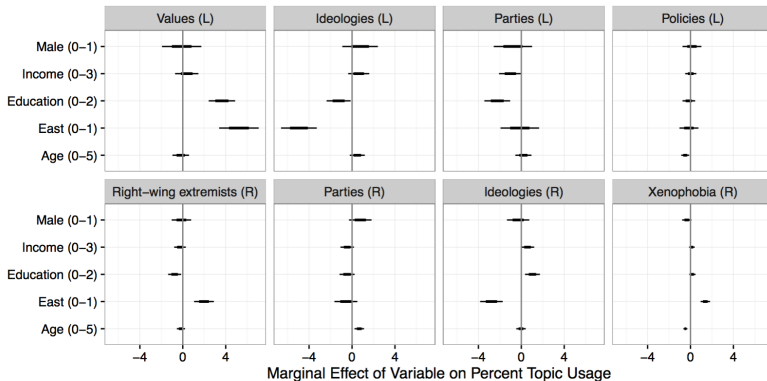

Fig. 7: Left-right scale means for different subsamples of associations with **right** (dashed = sample mean, bars = 95% Cis)

Bauer, Barberá *et al*, *Political Behavior*, 2016.

# Example: open-ended survey responses

Fig. 9: Systematic relationship between associations with “left” and “right” and characteristics of respondents

**Note:** Each line indicates a 95% confidence interval (and 66% confidence interval in darker color) for the coefficient of eight different regressions of topic usage (in a scale from 0 to 100) at the respondent level on seven individual-level characteristics. The line on the bottom right corner (second row, second plot), for example, shows that individual a one-category change in age is associated with around one percentage point increase in the probability that the individual associated “right” with political parties.

Bauer, Barberá *et al*, *Political Behavior*, 2016.

## Example: topics in US legislators' tweets

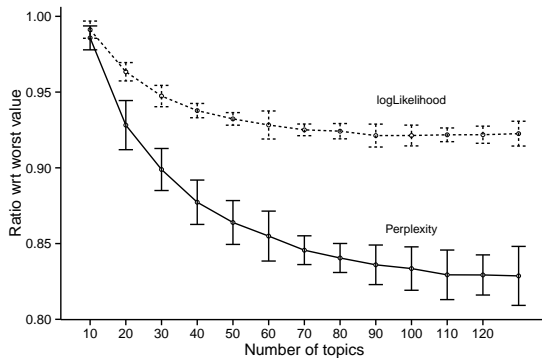

- ▶ Data: 651,116 tweets sent by US legislators from January 2013 to December 2014.
- ▶ 2,920 documents = 730 days  $\times$  2 chambers  $\times$  2 parties
- ▶ Why aggregating? Applications that aggregate by author or day outperform tweet-level analyses (Hong and Davidson, 2010)
- ▶  $K = 100$  topics (more on this later)
- ▶ Validation: <http://j.mp/lda-congress-demo>

## Choosing the number of topics

- ▶ Choosing  $K$  is “one of the most difficult questions in unsupervised learning” (Grimmer and Stewart, 2013, p.19)

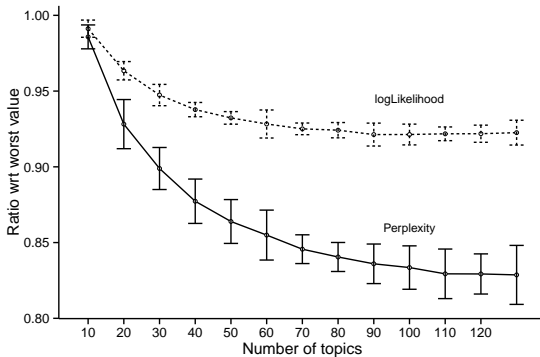

# Choosing the number of topics

- ▶ Choosing  $K$  is “one of the most difficult questions in unsupervised learning” (Grimmer and Stewart, 2013, p.19)
- ▶ We chose  $K = 100$  based on cross-validated model fit.

# Choosing the number of topics

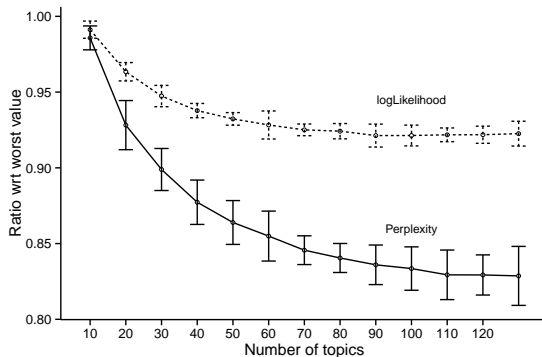

- ▶ Choosing  $K$  is “one of the most difficult questions in unsupervised learning” (Grimmer and Stewart, 2013, p.19)
- ▶ We chose  $K = 100$  based on cross-validated model fit.

- ▶ **BUT:** “there is often a negative relationship between the best-fitting model and the substantive information provided”.

# Choosing the number of topics

- ▶ Choosing  $K$  is “one of the most difficult questions in unsupervised learning” (Grimmer and Stewart, 2013, p.19)
- ▶ We chose  $K = 100$  based on cross-validated model fit.

- ▶ **BUT:** “there is often a negative relationship between the best-fitting model and the substantive information provided”.
- ▶ GS propose to choose  $K$  based on “substantive fit.”

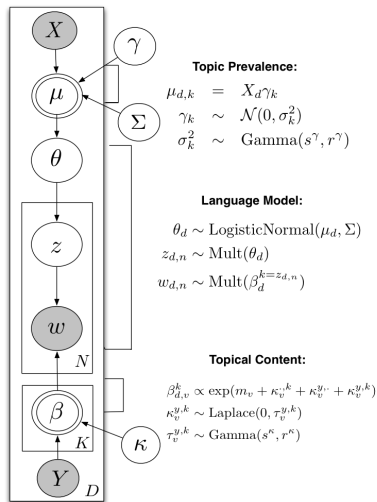

# Extensions of LDA

1. Structural topic model (Roberts et al, 2014, AJPS)
2. Dynamic topic model (Blei and Lafferty, 2006, ICML; Quinn et al, 2010, AJPS)
3. Hierarchical topic model (Griffiths and Tenenbaum, 2004, NIPS; Grimmer, 2010, PA)

Why?

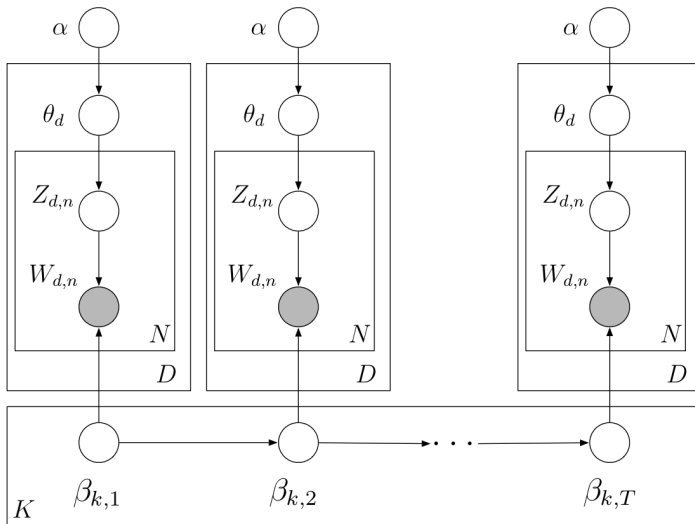

- ▶ Substantive reasons: incorporate specific elements of DGP into estimation
- ▶ Statistical reasons: structure can lead to better topics.

# Structural topic model

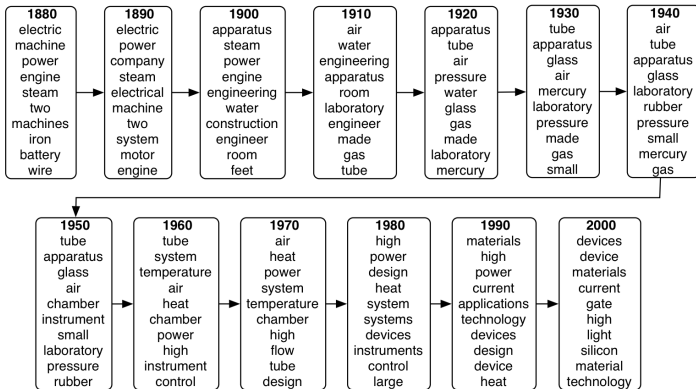

- **Prevalence:** Prior on the mixture over topics is now document-specific, and can be a function of covariates (documents with similar covariates will tend to be about the same topics)
- **Content:** distribution over words is now document-specific and can be a function of covariates (documents with similar covariates will tend to use similar words to refer to the same topic)

# Dynamic topic model

**Source:** Blei, "Modeling Science"

# Dynamic topic model

**Source:** Blei, “Modeling Science”

## Wordfish (Slapin and Proksch, 2008, AJPS)

- ▶ Goal: unsupervised scaling of ideological positions

## Wordfish (Slapin and Proksch, 2008, AJPS)

- ▶ Goal: unsupervised scaling of ideological positions
- ▶ Ideology of politician  $i$ ,  $\theta_i$  is a position in a latent scale.

## Wordfish (Slapin and Proksch, 2008, AJPS)

- ▶ Goal: unsupervised scaling of ideological positions
- ▶ Ideology of politician  $i$ ,  $\theta_i$  is a position in a latent scale.
- ▶ Word usage is drawn from a Poisson-IRT model:

$$W_{im} \sim \text{Poisson}(\lambda_{im})$$

$$\lambda_{im} = \exp(\alpha_i + \psi_m + \beta_m \times \theta_i)$$

## Wordfish (Slapin and Proksch, 2008, AJPS)

- ▶ Goal: unsupervised scaling of ideological positions
- ▶ Ideology of politician  $i$ ,  $\theta_i$  is a position in a latent scale.
- ▶ Word usage is drawn from a Poisson-IRT model:

$$W_{im} \sim \text{Poisson}(\lambda_{im})$$

$$\lambda_{im} = \exp(\alpha_i + \psi_m + \beta_m \times \theta_i)$$
